

EES for Codex

Installation and First Run Guide for Windows

What the skill adds, how to install it in the current Codex plugin interface, how the launcher is selected, and what a successful EES test looks like.

Plugin 0.5.0-beta	Launcher 0.5.0-beta	Windows 10/11
-------------------	---------------------	---------------

What you are installing

The skill guides. The launcher executes. EES calculates.

Could Codex simply run ees.exe?

Yes - a local task can start the program. The \$ees skill adds a repeatable model-and-result contract, routine search, workspace rules, directive checks, fresh-export checks, and troubleshooting. EES still performs every calculation.

What beta means

The beta labels apply to this Codex integration and launcher package, not to EES Professional. Run the complete installation test on each computer and review calculated models normally.

Before you begin

Have the EES executable path available and close the matching interactive EES application before installation or an automated solve.

You need	You do not need
Windows 10 or 11	Python or Node.js
EES Professional and its full executable path	Administrator rights
ChatGPT desktop with Codex and Plugins access	A PATH change or background service
Windows PowerShell 5.1 (included with Windows)	A separate PowerShell installation in the usual setup

PowerShell versions

Version	Status	What happens
Windows PowerShell 5.1	Supported	Used to start EES.
PowerShell 7	Supported	Launcher hands EES-starting commands to 5.1 automatically.
PowerShell 6	Not tested	Not required; do not treat it as a supported target.

Match the launcher to EES bitness

C:\EES32\ees.exe

32-bit EES -> launcher-32bit

Match EES, not Windows.

C:\EES64\ees64.exe

64-bit EES -> launcher-64bit

Match EES, not Windows.

Compatibility note

Launcher 0.5.0-beta has passed its complete test with 32-bit EES 12.3.4.0 and 64-bit EES 12.3.2.0. The exact minimum compatible EES version has not been established.

1. Add the EES marketplace

Open **Plugins** in Codex - usually from the left sidebar. Select **Add**, then **Add Marketplace**, then add a repository.

Illustration - sidebar placement and labels can vary by Codex version, account, and organization policy.

Field	Value
Source	https://github.com/EES-Community/ees-codex
Git ref	main
Sparse paths	Leave blank
Marketplace shown after sync	EES for Codex (identifier: ees-codex)

Local checkout?
Most users should use the GitHub source above. A local checkout is a maintainer/testing option; if used, choose the repository root containing `.agents\plugins\marketplace.json`, not `plugins\ees`.

2. Start or install the plugin

Open **Engineering Equation Solver** in the EES for Codex marketplace and use the action your app displays.

Illustration - Try now, Install, and the + button can represent the same next action in different app states.

- Choose **Try now**, **Install**, or the **+** button - whichever appears.
- If the plugin is already installed and working, do not uninstall it merely to make its button match this guide.
- After the first installation, start a **new Codex task** so the bundled skill is available.

Before starting EES

Use this read-only check to confirm that the skill loaded and whether launcher setup is still needed.

Verification prompt

Use the \$ees skill to explain what the skill and launcher provide and tell me whether launcher setup is still required. Do not start EES yet.

3. Ask Codex to install the launcher

There is no separate launcher-choice screen in the normal agent-driven flow. The complete EES executable path tells the skill which package to use.

Recommended setup prompt

Use the \$ees skill to install the launcher for my EES Professional at [full path to ees.exe or ees64.exe]. Use the recommended launcher and workspace locations, run the complete installation test with normal Windows filesystem access, and report the exact workspace path.

EES executable	Launcher	Recommended workspace
...\ees.exe	%LOCALAPPDATA%\EES-Codex-Launcher-32bit	%USERPROFILE%\EES-Codex-Workspace-32bit
...\ees64.exe	%LOCALAPPDATA%\EES-Codex-Launcher-64bit	%USERPROFILE%\EES-Codex-Workspace-64bit

Approval is conditional

You may see an approval request when Codex starts the installer or EES. If shown, review the EES executable, launcher folder, and workspace before approving. If no approval panel appears and the complete test succeeds, that is not an error.

Recommended access policy

Keep the project sandbox enabled and use Ask for approval. Commands that start native EES need targeted normal Windows filesystem access; catalog-only searches can remain sandboxed.

4. Recognize a successful installation

Success is usually a text response in the Codex task, not a separate installer screen. Wording and layout can differ.

Example successful report - your response will contain actual full paths

```
Installed launcher 0.5.0-beta for C:\EES32\ees.exe.  
  
Launcher: %LOCALAPPDATA%\EES-Codex-Launcher-32bit  
Exact workspace: %USERPROFILE%\EES-Codex-Workspace-32bit  
  
The complete installation test passed:  
- 200 kW heat-exchanger result  
- compact catalog and result extraction checks  
- five application-library calculations  
- persistent autoload setting unchanged
```

Required evidence	What to confirm
Selected executable	Correct EES path and matching 32-bit or 64-bit launcher
Exact paths	Launcher folder and generated workspace are both reported
Real EES solve	Heat-exchanger result is 200 kW
Library checks	Metadata plus Component, Mechanical, NASA, Incompressible, and Heat Transfer checks pass
Persistent setting	Application-library autoload setting is unchanged
Overall status	Complete test passed; 'files installed' alone is incomplete

Open the exact workspace

Use the path reported by Codex. It should contain AGENTS.md, launcher-config.json, examples\, models\, results\, and tests\.

First prompt after opening that workspace

```
Read AGENTS.md and launcher-config.json. Run the installed installation test, then explain how you will  
safely create, solve, and inspect EES models in this workspace. Do not modify the installed launcher.
```

5. Run a first audited model

Start a new task in the generated workspace and use a small calculation that is easy to check independently.

Codex

New Codex task

Use the \$ees skill to calculate the rate of heat transfer required to increase the temperature of water flowing at 1 kg/s and 200 kPa from 20 C to 60 C. Save the model and exported result, check units and the energy balance, and explain the assumptions.

Send

Expected: model + fresh export + engineering checks

Illustration - the final response should identify the model, fresh result, units, assumptions, and energy-balance check.

Copyable first-model prompt

```
Use the $ees skill to calculate the rate of heat transfer required to increase the temperature of water flowing at 1 kg/s and 200 kPa from 20 C to 60 C. Save the model and exported result, check units and the energy balance, and explain the assumptions.
```

How the workflow should proceed

- Models and exported results remain inside the selected workspace.
- Catalog search starts compact; retrieve full routine detail only when it is needed.
- Result extraction returns requested variables compactly; full detail remains available for audits and debugging.
- A successful solve is not proof that a model is correct. Check units, balances, feasibility, constraints, and assumptions.

If the normal path does not work

Most users need only Steps 1-5. Use the table below only when the normal flow stops or the plugin is already present.

What you see	What to do
Try now, Install, or +	Use the displayed action. The label varies by app version and installation state.
Plugin already works	Do not reinstall. Start a new task and run the verification prompt from Step 2.
Marketplace registered from another source	Inspect the registered name and root before removing anything; follow the recovery below.
Local marketplaces unavailable	Use the advanced manual skill-copy fallback in the repository README; launcher setup is still separate.

Recover an older personal marketplace

Early prerelease copies used the generic marketplace name `personal`. First inspect the configured roots. Remove only an obsolete EES entry; a personal marketplace may contain unrelated plugins.

Safe inspection and conditional removal

```
codex plugin marketplace list --json
codex plugin list --json

# Only after verifying that these are the obsolete EES entries:
codex plugin remove ees@personal --json
codex plugin marketplace remove personal --json
```

After removal

Fully quit and restart the ChatGPT desktop app, then add the repository again. Do not delete `.codex\plugins\cache` as a first step. The current marketplace uses the unique identifier `ees-codex`.

Updates and sources

The skill and launcher are released as one coordinated version. After updating the plugin, ask the `$ees` skill to install the matching launcher, then rerun the complete installation test.

Notices

EES Professional, executable EES libraries, an EES license, Codex, and OpenAI software are not included. The repository packaging is source-available but not open source. `EES_Tool_Metadata.json` is generated from Database22 and redistributed with the owner's permission. Tests demonstrate software execution; engineering correctness, design fitness, and safety require independent review.
